

# How to connect the power wires of the base station on the roof

## Overview

---

How do I install underground wiring from a pole to my house?

Installing underground wiring from the pole to your house requires a series of steps that must be done carefully to ensure safety, functionality, and code compliance. Before starting the installation, check with your local utility company and governing authorities to obtain the necessary permits.

How does a home electrical system work?

Wires lead off from the neighbourhood's power lines and connect to individual buildings (homes, apartments, businesses, etc) by first going through the electric meter to measure how much electricity the home uses. The electricity then passes through a service panel, which houses the electrical safety devices (circuit breakers and fuses).

How is a home connected to the electrical grid?

Every home is connected to the electrical grid through some sort of fuse box or circuit breaker as shown in figure 1. The overhead power connection from the utility lines to the service entrance is referred to as the service drop. It has three wires; 1 neutral line and 2 hot lines.

How do you wire a breaker panel?

Connecting the hots, neutrals and ground incoming from the meter base to the proper breaker-panel buses is the first step in wiring the panel. Even though there's a second main breaker in the breaker panel, the ground and neutrals are separate here, connecting only at the first main breaker at the meter base.
