

Solar Panel Construction

Overview

What are solar panels made of?

Solar panels are built with several layers, each serving a specific purpose:
Glass Layer: The top layer is made of glass. It protects the panel from environmental elements while allowing sunlight to pass through.

How do solar panels work?

Larger solar panels used for commercial systems and utility-scale solar farms contain 72 full-size or 144 half-size cells and, in turn, operate at a higher voltage. The electrical contacts that interconnect the cells are known as busbars and allow the current to flow through all the cells in a circuit.

How many components are used in the construction of a solar panel?

The 6 main components used in the construction of a solar panel 1. Solar PV Cells Solar photovoltaic cells or PV cells convert sunlight directly into DC electrical energy. The solar panel's performance is determined by the cell type and characteristics of the silicon used, with the two main types being monocrystalline and polycrystalline silicon.

How is a PV panel constructed?

After the PV cells are manufactured, individual cells are tested for their power output and binned with cells of similar power output and electric characteristics. A panel is constructed from cells within the same bin to reduce mismatch between cells strung in series. A typical construction of a PV panel is shown in Fig. 3.13.
