# Solar water pumping system in Croatia

## Overview

---

What is a solar water pump?

A solar water pump theoretically consists of three key components: a pump control system that may be just an on-off switch or may be a more complex electronic unit, a motor and the pump; however, in practice they are considered as one unit and generally called the “water pump” or in this guideline the “solar water pump”.

Where is a solar water pump located?

In these systems the solar water pump is located within the borehole or well. These pumps are generally available for 100 mm (4 inch) and 150 mm (6 inch) boreholes. The solar array is typically located near the top of the borehole/well and the water is generally pumped to a storage tank. The pump controller is typically located at the solar array.

What are the components of a solar water pumping system?

A solar water pumping system consists of three major components: the solar array, pump controller and electric water pump (motor and pump) as shown in Figure 1. Note: Motor and pump are typically directly connected by one shaft and viewed as one unit, however occasionally belts or gears may be used to interconnect the two shafts.

How do you design a solar water pumping system?

When designing a solar pumping system, the designer must match the individual components together. A solar water pumping system consists of three major components: the solar array, pump controller and electric water pump (motor and pump) as shown in Figure 1.

## Solar water pumping system in Croatia

### Xylem, Lorentz Partner to Accelerate Deployment of Solar ...

Climate-related droughts and severe weather events have increased stress on water supplies, putting pressure on communities to both secure supply and decarbonize energy-intensive ...
