The role of outdoor power station for base station communication

Overview

How does a base station work?

Depending on the size of base station and its traffic, the base station may also have another sources of power such as a diesel generator, wind turbine or biofuels. The base station is a transceiver and acts as an interface between a mobile station and network using microwave radio communication.

What is base station Power?

Base station power refers to the output power level of base stations, which is defined by specific maximum limits (24 dBm for Local Area base stations and 20 dBm for Home base stations) and includes tolerances for deviation from declared power levels, as well as specifications for total power control dynamic range. How useful is this definition?

What are some examples of solar-powered base stations?

Below are some examples of the use of solar-powered base stations for disaster-struck and remote areas. In Vermont, United States, a Canadian border town of Norton maintained communications with the outside world by using a solar panel and battery system on a cell tower during flooding from Tropical Storm Irene in 2011.

What is a solar-powered base station?

A solar-powered base station as shown in Fig. 5.14 consists of a PV powering unit, a base station and a cooling unit. The base station uses radio signals to connect devices to network as a part of traditional cellular telephone network and solar powering unit is used to power it.

The role of outdoor power station for base station communication

[Base stations and networks](#)

The antenna output power level is typically between 20 watts and a few hundred watts for an outdoor base station. Television transmitters, by comparison, have 10-1000 times ...
