

Thickness of double glass components

Overview

What is the thickness of a glass module?

The thickness of the front glass generally used for this type of structure is 3.2 mm. Dual-glass type modules (also called double glass or glass-glass) are made up of two glass surfaces, on the front and on the rear with a thickness of 2.0 mm each.

How thick is double glazing?

The overall thickness of double glazing is determined by the depth of the 1st pane of glass plus the spacer bar and the 2nd pane of glass. You might have seen this written out as a notation like 4 – 12 – 4, which means a 4mm pane of glass, 12mm spacer bar, and 4mm pane of glass, resulting in an overall depth of 20mm.

What are the different thicknesses of glass?

The most common thicknesses you'll find are 6mm, 8mm, and 10mm. While a thicker glass often gives a more sturdy and luxurious feel, it also comes with a higher price tag and more weight. A 6mm thickness is a popular standard because it provides a great balance of strength and affordability for most enclosures.

What factors affect the thickness of a double glazed unit?

Several factors come into play, including the glass thickness, the width of the spacer bar, and the type of window frames you have. The overall thickness of a double-glazed unit is a combination of these elements, all working together to prevent heat loss.

Thickness of double glass components

[Thickness of double-sided double-glass components](#)

What is the thickness of a glass module? The thickness of the front glass generally used for this type of structure is 3.2 mm. Dual-glass type modules (also called double glass or glass-glass) ...
