

Wind turbine fire control system

Overview

Do wind turbines need fire protection?

Some fire protection systems are recommended for wind turbines, but each case must follow even more specific safety recommendations. The systems mentioned in NFPA 850 include gas systems, water mist, compressed air foams, and aerosols.

How can a wind turbine detect a fire?

Integrating traditional detection systems, such as heat and smoke detectors, linear heat detecting cables, and air-purification systems, wired through a turbine's existing supervisory control and data acquisition system (or SCADA). This can permit remote notification of a developing fire and support rapid response.

Should wind farms retrofit fire suppression systems?

As wind farms prep for eventual replacements, retrofitting fire suppression systems remains a viable interim opportunity to both safeguard existing turbines and increase the ability of operators to coordinate fire protection across their facility's footprint, which typically extends over thousands of acres.

How can wind farms reduce fire risk?

Each wind farm requires careful engineering and environmental assessments to determine the right combination of fire suppression systems and strategies, but at a high level, common opportunities to reduce fire risk include: Installing an automatic fire suppression system, such as a clean agent, inert gas, or aerosol extinguishing system.

Wind turbine fire control system

Fire risk assessments and fire protection measures for wind turbines...

The study finishes with a description of the active and passive fire protection systems, as well as the economic costs and insurance of wind turbines, to compare the value ...
